

What is Secfense IDP?

Secfense Identity Provider (IdP) is an innovative solution from Secfense - a leader in the field of cybersecurity. With this tool, organizations have full control over the management of digital identities from various sources.

Secfense IDP allows for flexible identity settings configuration, using different IAM tools without being limited to one provider, and implementing advanced security features such as passwordless authentication.

Problem / Challenge

Migrating identities between IAM systems can be costly, problematic, and have organizational challenges. Using multiple IAM tools can lead to increased costs, overburdening of the support department, and difficulties in managing employee identities. Many providers offer varied features in diversified packages, which may force the purchase of more expensive versions to obtain key security features for the company.

„I am wondering if there are people whose companies have successfully migrated from OKTA to Azure Active Directory or Ping Identity. What were your experiences like during the migration (easy/hard/loss of functionality etc.)? How big of an effort was it (number of months etc.)?”

I am wondering if choosing Okta for my company would be locking my company in a way that will make it impossible to migrate? (...)”

 **Reddit /Okta**

You can migrate from Okta to Azure (or any other IAM) at your own pace. Secfense IdP works as a smart switch between IAM tools and sets you free from IAM vendor lock-in.

Benefits of Secfense IDP

Full control over identities: Secfense IDP acts as a switch between different IAM systems, allowing organizations to have full control over their employees' identities.

Flexibility: Thanks to Secfense IDP, organizations can take advantage of the best features of various IAM providers without losing the functionalities offered by other tools.

Top-level Security: The tool allows the implementation of security features such as conditional access, bot detection, behavioral biometrics, and passwordless authentication.

Savings: Secfense IDP allows companies to use advanced security features without the need to invest in expensive packages offered by IAM providers.

„We are migrating our authentication services to Azure AD. Currently we use OKTA.

Can we have both systems running at the same time to avoid downtime, or does OKTA need to be disabled in order to have azure AD integration working?

We use Atlassian Cloud and have Atlassian Access.”

”” Atlassian Community

You can have OKTA and Azure AD (or any other IAM) at the same time. Secfense IdP works as a smart switch between IAM tools and lets you regain complete control over your identities.
